

Degrees Display With Digi-ruler scale

We have modified the Sony LH-series display to read degrees, minutes and seconds or degrees and one thousands of a degree. There are additional decimal points added, and in the degrees, minutes & seconds mode the unit counts up to 359 degrees, 59 minutes and 59 seconds.

The accuracy depends on the diameter of the of the rotary table. We install the Sony digi-ruler scale around the outside circumference of the table and use the PL-20 non-contact reader head.

The display calibration is done by using a master square. The display has a switch and a button on the rear of the unit for setting the degree compensations.
